Limited Warranty

All Cathodic Technology Limited (Cath-Tech) instruments and equipment are warranted against defects in materials, design or workmanship for a period of two years from date of sale. This warranty excludes damage due to misuse, abuse, tampering or acts of God such as fires, floods, wind damage, lightning etc.

We will repair or replace at our option any defective component, after examination in our manufacturing facility, if the fault is due to defective materials or labour, within two years of the purchase date. For warranty repair, a Returned Goods Authorization (RGA) must be obtained from Cathodic Technology Ltd prior to shipping the defective unit pre-paid to our location.

Note: There is no warranty expressed or implied on batteries.

Cath-Tech Policy

- Cath-Tech extends a two-year in use warranty on all units, which have been designed and/or manufactured by Cath-Tech staff.
- Cath-Tech reserves the right to make any changes in design or specification which it deems an improvement, with no liability to make the same changes on existing equipment.
- This warranty is in lieu of all other warranties or guaranties, expressed or implied, which might otherwise exist. The purchaser is relying only upon this guarantee and not upon any representations not herein expressed.
- Any material or equipment being returned to the factory must first have a Returned Goods Authorization (RGA) from Cath-Tech.

Welcome

Thank you for selecting the CI-25 / CI-50 GPS synchronized current interrupter. CATH-TECHTM is the world leader in electronic equipment for corrosion control.

The CI-25 / CI-50 GPS synchronized current interrupter is equipped with a GPS engine to ensure accurate synchronization with other interrupters no matter how far apart.

Your CI-25 / CI-50 GPS synchronized current interrupter is a precision instrument. It is designed to interrupt the current flow from your cathodic protection rectifier or sacrificial anode system on a cyclic basis.

Open and inspect your CI-25 / CI-50 GPS synchronized current interrupter on receipt. If any damage occurred during shipping, file a claim with the carrier immediately.

Rating Info

The CI-25 is rated for a maximum of 25 Amps at 100 Volts DC.

The CI-50 is rated for a maximum of 50 Amps at 100 Volts DC.

Both the CI-25 and CI-50 interrupt DC only, not AC.

It is important to connect the current interrupter into the circuit properly; failure to do so may result in damage to the unit.

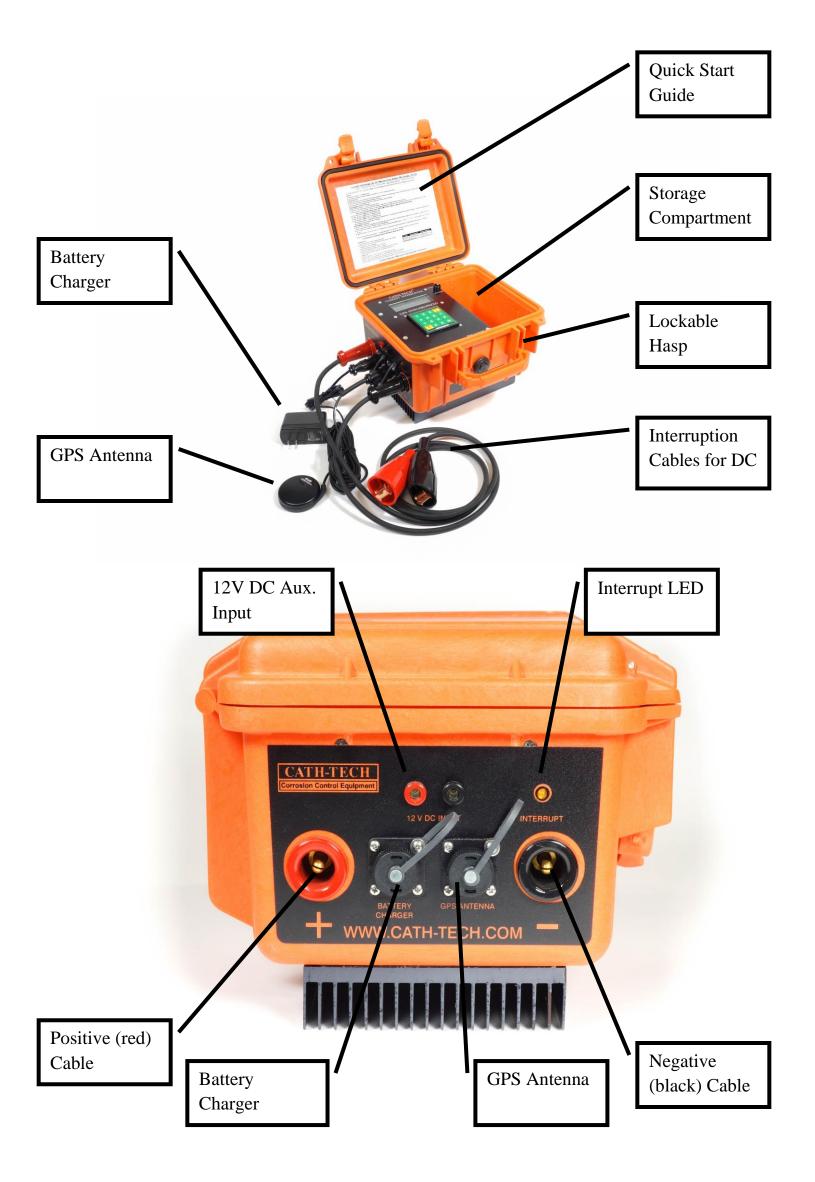

Safety

Do not operate the CI-25 / CI-50 GPS synchronized current interrupter during electrical storms. Damage to both the CI-25 / CI-50 GPS synchronized current interrupter and the rectifier could occur.

The installation of the CI-25 / CI-50 GPS synchronized current interrupter requires electrical connections in the rectifier. Only personnel who are trained in electrical safety should undertake this.

The CI-25 / CI-50 can interrupt DC current only. Please observe safety precautions when installing the interrupter. Turn the AC supply to the rectifier OFF and verify with a volt meter before making any connections to the rectifier.

Features

Charging

Before connecting the CI-25 / CI-50 to the rectifier, charge the battery overnight with the supplied battery charger. The CI-25 / CI-50 will run from mains power and/or the internal rechargeable nickel metal hydride battery. It is recommended that the battery be fully charged before installing the interrupter in a rectifier. The battery can become permanently damaged if not charged regularly. When in storage we recommend plugging in a charging at least once every 60 days.

The battery charger is a universal charger compatible with 110V to 240V AC, 50 or 60 Hz. When the mains power cord is plugged into an active power outlet, the red light on the charger end will illuminate, indicating active power.

The CI-25 / CI-50 can also be charged and powered by an external DC power source of 12-14 V DC. Leads from the power source are plugged into the red and black receptacle on the side of the unit.

If the CI-25 / CI-50 is turned on with a low battery, it is possible that the processor will stall. Allow the CI-25 / CI-50 to charge for a few minutes then press the reset switch to reset the processor.

Setup

Prior to turning on the unit, it is best to attach the GPS antenna if you will be using GPS synchronization. To turn the unit on, press the * key on the keypad or press the reset button. As the unit activates, the following message will appear on the screen:

```
CATHODIC TECHNOLOGY
2 VIII 2006 V128el
```

The second line indicates the version of firmware currently installed. After a short delay, the main menu will be displayed.

Main Menu

The main menu allows the user to program the unit to operate. If there is no user input after 20 seconds, the unit will go into operation and run whatever programs it currently has stored. The options on the main menu are as follows;

CATHODIC TEC	HNOL	DGY	
E-program I-	off		
0-RS232			
C-GPS-power	GPS	ON	

E-program	This allows the user to see and change the programs currently
	in the current interrupter's memory.

C-GPS-power This option turns the GPS power on and off. For GPS synchronized surveys, GPS power must be on.

0-RS232 Not in use with this product
I-off This option turns the unit off. Turning the unit off when not deployed will save the battery life. The unit can be turned on again by pressing * on the keypad or the reset button.

At any time the user may return to the main menu by pressing the reset button or press both yellow keys simultaneously.

E-program

Prior to using your current interrupter, the unit must be programmed with your desired current interruption cycle. From the main menu screen, press E to access the programming mode.

OFF Time

The first input will be the length of time OFF.

```
0200 ms off
C-change N-ok
```

To change this value press C and enter a 4 digit off time in ms. 1 second = 1000 ms.

If you only enter 3 digits, the program interprets that as having an extra 0 on the end. For example, entering the number 200, the program will make your off time 2000 ms. Instead, type in 0200.

After you are satisfied with the off time, press N to move on.

Cycle Time

The next screen asks for the cycle time to be set. The cycle time is the total time of the interruption cycle including the OFF and ON time. Some standard cycles are:

Off Time	Cycle Time	
200 ms	1 sec	This results in 800 ms on
400 ms	2 sec	This results in 1.6 seconds on
1 sec	4 sec	This results in 3 seconds on

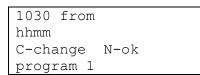

The current interrupter has pre programmed cycles ranging from ¹/₄ second to 6 minutes. Press C to cycle through the options. The available cycles are:

¹/₄, ¹/₂, 1, 2, 3, 4, 5, 6, 10, 12, 15, 20 and 30 seconds, 1, 2, 3, 4, 5 and 6 minutes

The cycle time should always be greater than the OFF time. When the correct cycle time is displayed, press N to accept and move on.

Start Time

The next screen asks for the starting time of the cycle. The value is entered in a 24 hour clock format. i.e. 2pm = 1400 hours.

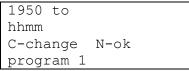

All times in the current interrupter are in Coordinated Universal Time (UTC). You must calculate your start and stop times by adding or subtracting your local time as appropriate.

Press C to change the starting time and enter your new time in hours and minutes. Press N once you are satisfied to move on.

Stop Time

The next screen asks for the ending time of the cycle. The value is entered in a 24 hour clock format. i.e. 2pm = 1400 hours.

All times in the current interrupter are in Coordinated Universal Time (UTC). You must calculate your start and stop times by adding or subtracting your local time as appropriate.

Press C to change the starting time and enter your new time in hours and minutes. Press N once you are satisfied to move on.

Start Date

The next screen asks for the starting date of the cycle. The value is entered in 4 digits representing the month and day.

0101 from
mmdd
C-change N-ok
program 1

Press C to change the starting time and enter your new date in month and day. Press N once you are satisfied to move on.

End Date

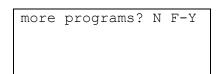

The next screen asks for the ending date of the cycle. The value is entered in 4 digits representing the month and day.

1231 to	
mmdd	
C-change	N-ok
program 1	

Press C to change the starting time and enter your new date in month and day. Press N once you are satisfied to move on.

Additional Programs

Once the first program is complete, the unit asks if there are any additional programs to be entered.

For example, you can program the unit to work Monday to Friday, 7am to 7pm. Then program 2 will have the unit work Monday to Friday the following week.

Press F to enter another program or press N to exit the programming mode and return to the main menu.

C-GPS-power

On the main menu the GPS function can be turned on or off by pressing C. GPS must be on to be synchronized with other interrupters and survey equipment.

When the GPS is turned off, a slightly different main menu is shown.

CATHODIC TEC	HNOLOGY
E-program I-	off
0-RS232 N-	time
C-GPS-power	GPS OFF

The extra option is to set the date and time on the unit so it can go through the programs. N-time is only available in GPS off mode.

yymmddhhmmss

The date and time is entered as one long numerical string with two digits for the year, month, day, hour, minute and second. Once programmed, the internal clock will keep track. After the date and time have been successfully programmed, it will be shown on the main menu.

13:07:52	25/12/10
E-program	I-off
0-RS232	N-time
C-GPS-powe	er GPS OFF

0-RS232

This option is not currently available with this product. If you require RS-232 access, please contact the factory.

Connection

Rectifier

Before connecting the CI-25 / CI-50 to the rectifier, turn the CI-25 / CI-50 ON and program the CI-25 / CI-50. Always turn the rectifier OFF and check with a meter before performing any work inside the rectifier case. Follow your company procedures for rectifier access.

Anode Circuit:

To connect to the anode or positive side of a rectifier, first turn OFF the rectifier and the CI-25 / CI-50. Then connect the CI-25 / CI-50 (Red Terminal) to the + terminal of the rectifier and the (Black Terminal) to the anode lead. Switch the CI-25 / CI-50 ON, then the rectifier.

Pipe or Structure Circuit:

To connect to the structure or negative side of a rectifier, first turn OFF the rectifier and the CI-25 / CI-50. Then connect the CI-25 / CI-50 (Red Terminal) to the Pipe Lead and the (Black Terminal) to the Negative (-) terminal of the rectifier. Switch the CI-25 / CI-50 ON, then the rectifier.

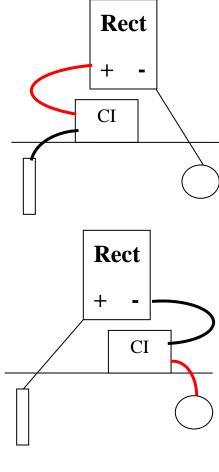

Sacrificial Anode Bed

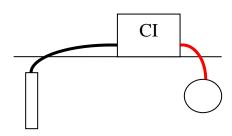

To connect to a sacrificial anode bed, turn the CI-25 / CI-50 off and disconnect the anode bed from the structure. Connect the Positive (+) (Red Terminal) of the interrupter to the structure and the Negative (-) (Black Terminal) of the interrupter to the sacrificial anode bed. Switch the CI-25 / CI-50 ON.

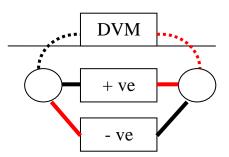

Bonds Between Pipelines

To interrupt a bond, determine which way the current is flowing. Using a volt meter, measure the voltage across the resistor in the bond. If the meter voltage is positive, then the pipe on the + side of the meter is

more positive and should be connected to the red side of the interrupter. If the meter voltage is negative, then the pipe on the + side of the meter is more negative and should be connected to the black side of the interrupter.

GPS (Global Positioning System)

The GPS antenna is equipped with a magnet base to allow the antenna to be placed on top of the rectifier. The GPS antenna must be placed in a location where it has a clear view of the sky. In the Northern Hemisphere the GPS antenna should have a clear view of the southern sky and in the Southern Hemisphere the GPS antenna should have a clear view of the northern sky. GPS Antenna extension cables are available from Cathodic Technology Limited in 30 metre lengths.

If the CI-25 / CI-50 has been moved more than 50 Km. it may take a few minutes for the GPS engine to re-establish its almanac and obtain a lock on the Global Positioning Satellites. When the GPS engine has acquired the minimum number of satellites and it has calculated its position the UTC time and location will be shown on the screen.

Heat Sink

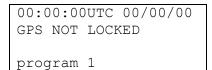

During operation the internal relays can generate heat. Ensure the heat sink on the bottom is free of debris and has some air movement. Heat dissipation can be improved by setting the unit on its side to improve air circulation.

Operation

After turning the unit on, the main menu is displayed. If there is no user input then the unit will switch to run mode after 20 seconds. The menu is obscured briefly by a series of boxes as the unit switches to run mode.

C TEC	HNOLOGY
E-program I-	off
0-RS232	
C-GPS-power	GPS ON

Once in run mode, the unit looks for the GPS lock. At first the screen will look like below:

After the unit receives the GPS lock, it will display the GPS information.

The unit must have a GPS lock for the program to run and the unit to interrupt. A minimum of 4 satellites are required for the lock. Beside the program number that is currently running there will be two boxes; the first indicates that the program is activated and the second flashes with the interruption cycle.

If only one block appears, check the programming, your interruption cycle time may not be active at the moment. If the blocks do not appear (or the program number keeps changing) then a valid program hasn't been entered. See the Programming section and enter a valid program.

On the side of the case there is an amber LED that flashes with the interrupt cycle to provide a quick visual indication of successful operation.

When the program is not interrupting the rectifier, the output is held ON to minimize depolarization of the cathodic protection levels.

When the GPS is turned off, the operations screen is slightly different.

If the time and date show all zero's and don't change, then return to the main menu and re-enter the date and time.

Maintenance

There are very few user serviceable parts on the CI-25 / CI-50. It is good practice to store the CI-25 / CI-50 in a cool, dry place when not in use. For best battery life, the battery should be fully charged once every 2 months.

If the unit does not interrupt;

- Ensure the battery is charged. Use a volt meter to check the voltage across the 12 V external power plugs, it should read above 7V.
- Check the program, it may not be programmed to interrupt that day.

For other problems, please contact Cathodic Technology at ++1-905-857-1050 or <u>ctl@cath-tech.com</u>.

Spare Parts

Below is a list of spare or replacement parts available for the CI-25 / CI-50 from Cathodic Technology. Most parts are in stock and can ship in 2 business days.

Visit <u>www.cath-tech.com</u> to view our wide range of products and services.
